

Shubham Prakash Thorve

Full Stack Software Engineer | MSc in Advanced Computer Science | Glasgow, United Kingdom
+44 07586382125 | +91 9764292149 | thorveshubham@gmail.com | [GitHub](#) | [LinkedIn](#) | [Leetcode](#)

Skills

Backend Technologies – Java 21, Spring Boot, Microservices, Node.js, Python, Apache Kafka, AWS Cloud, CI/CD

Frontend Technologies – Angular 12+, React, Socket.io, jQuery, JavaScript, TypeScript, HTML, CSS

AI Tools – GitHub Copilot, Agents, Custom Agents, Skills and Instructions

Databases – MySQL, PostgreSQL, Oracle, MongoDB, SQL, NoSQL, Vector Search

Testing Frameworks/Others – TDD, JUnit, Mockito, Docker, Kubernetes, Design Patterns, Agile Methodologies

Experience

JP Morgan Chase

Glasgow, Scotland, UK

Associate Software Engineer II - Data Observability Product - Broadsword

March 2025 – Present

- Diagnosed and eliminated a platform-wide Kafka throughput bottleneck caused by suboptimal consumer resource configuration, cutting end-to-end processing time from ~45 minutes to 17 minutes in Java 21 / Spring Boot 3.x microservices processing 100k events.
- Designed and built an event-export pipeline from first commit to production as sole engineer, streaming MongoDB data to AWS S3 and Databricks in Avro/Parquet for downstream analytics.
- Authored the team's Terraform AWS infrastructure repository from the ground up; VPC/KMS/IAM networking, Databricks cluster provisioning, and Spinnaker/Jib CI/CD for a new dedicated AWS account
- Built the team's standard AI-assisted development workflow, custom GitHub Copilot agents, skills and prompt templates spanning planning, implementation, testing and automated PR review, with internal MCP server integration; adopted by ~10 engineers as group standard practice.

BMC Software

Pune, India

Product Developer - [BMC AMI Strobe](#)

Sept 2022 – Dec 2023

- Reduced the Kanban triage time by 26%, which significantly improved customer satisfaction and issue resolution speed.
- Contributed to the frontend migration from JSP to Angular 12, decreasing UI latency by 19% and supported the backend migration from Java 11 to Java 17 for Spring Boot 3.x and future support.
- Streamlined operations through automation using Python scripts, reducing manual effort for updating application help content every release.
- Partnered with z/OS developers to design visualisations for BMC AMI Strobe product metrics, such as CPU usage and measurement execution time, to identify application that needs tuning.

Nextgen Healthcare LLC

Remote

Engineer I - [Nextgen Office EHR](#)

Mar 2021 – Sept 2022

- Developed and implemented features in NG Office HER, NGO Patient Portal using Java 11 and Angular 12, enhancing web application functionality.
- Developed the MobileRx feature, compatible with small devices, enabling practitioners to prescribe medications to patients directly via mobile phones.
- Delivered FHIR API integration, resulting in a 10% increase in EHR license renewals and improved product offerings.
- Facilitated product deployment in production; was the first developer to perform and understand the CI/CD flow in the production deployment.
- Implemented Keycloak-based SSO for FHIR APIs, allowing secure patient login to share FHIR resources across other providers like Athena Health and Smile Digital Health.

e-Zest Solutions

Pune, India

Software Engineer - [Acti-on - AI-driven Action Engine](#)

Sept 2020 – Mar 2021

- Employed Camunda for process orchestration, executing workflows designed with BPMN diagrams and integrating the BPMN environment into the Angular framework for in-app design.
- Configured Apache Kafka JDBC Connectors to listen to various events on database tables, enabling automated BPMN workflow triggers.
- Built the web application frontend from scratch in Angular 8 with lazy-loading and reusable component-based architecture for improved loading times and modularity.
- Collaborated with software development teams and product managers to design and develop scalable solutions that met client requirements for functionality and performance.

- Created automated scripts using Python to streamline common tasks, significantly reducing manual effort and improving efficiency.

Capgemini

Software Engineer

Navi Mumbai, India

Sept 2018 – Dec 2019

- Assisted General Electric (GE) in managing seamless data transmission across its SAP systems, ensuring data accuracy and consistency.
- Performed data mapping and integration using SAP PI and Java 8, improving data flow and system interoperability.
- Monitored and troubleshooted messages between SAP systems, ensuring smooth and reliable communication across platforms.
- Analysed message transfer logs using the SAP PI monitoring tool to identify issues, prepared consolidated data-driven reports in Excel, and presented findings to respective teams, ensuring timely escalation of critical issues.

Personal Projects

Issue Tracker - [Frontend](#) | [Backend](#)

Apr 2020 – May 2020

- Designed and developed a full-stack issue management web application by using Node.js for the backend APIs, Angular for the frontend component-based development and MongoDB for the database.
- Facilitated real-time issue updates to users with WebSockets, enhancing user engagement and interaction.
- Integrated APIs with AWS S3 for storing attachments related to issues, and deployed the application to an AWS EC2 instance with Nginx as a server.
- Built key features like issue creation, tracking, watch mechanisms and role-based access control (RBAC) using JWT authorisation and automated email notifications.
- Used standard tech stack consisting of Express.js, MongoDB, Webpack, and ESLint for streamlined development and deployment.

Expense Splitter - [Frontend](#) | [Backend](#)

May 2020 – June 2020

- Developed a full-stack expense management system, allowing users to form groups where they can track, split and settle expenses.
- Enabled real-time notifications to logged-in users using WebSockets and email notifications to other users, enhancing user interaction.
- Deployed the application on an AWS EC2 instance with Nginx server and utilised the AWS Route 53 service for domain management of the application.
- Leveraged a robust tech stack, including Node.js, Angular, Express.js, and MongoDB for quick and efficient API development.

Education

University of Strathclyde

Glasgow, United Kingdom

Master's in advanced computer science - Distinction

Jan 2024 – Dec 2024

- Built Machine Learning and Deep Learning models using sklearn, transfer learning with TensorFlow, and PyTorch for regression and classification problems.
- Built an Android health application focused on weight loss that tracked calories and utilised mobile sensors such as a pedometer for step count, location for Geofencing, Google Sleep API for real-time notifications in agreement with Fogg's behaviour change model (Kotlin, Jetpack Compose) - [GitHub Link](#)
- Gained expertise in search-based software engineering, solved single and multi-objective problems using climber and genetic algorithms with Python and the DEAP framework.

Pune University

Pune, India

Bachelor of Computer Engineering – GPA 2:1

June 2014 – May 2018

- Applied foundation knowledge that was gained while learning Operating Systems, Object-Oriented Programming, Database Management Systems and J2EE Web Development to build a grocery management application in 3rd year.
- Completed an intensive 3-months of full stack development programme at Zensar Solutions, developing web applications using Java, JavaScript, jQuery and Oracle Database.
- In the final year, developed and published a paper on a [Dictionary Application with Speech Recognition and Speech Synthesis](#).
